Photo collage tool free

Hello, I have this picture. (Kylie Jenner) Swipe the image to Photoshop. Unlock the image first by clicking on it twice in the layers. Use magic wand tool (shortened-W in windows) to remove the background. Select the unwanted area and delete it. Your image with transparent background is ready. PressCTRL - N for the new file and choose A3 with 150 resolution (for printing enough sound), you can also keep resolution 300. [attached image] Name it hair_collage or whatever you want to name. Take your transparent image to hair_collage, it will be called Layer1 adapting it to the artboard by pressing CTRL-T (to transform it) and SHIFT-move (move it only from diagonals, Press SHIFT to keep the shape of the image the same) - OPTIONAL STEP -Now switch to the image-adjusted right and adjust the brightness (I set it to 71) [image]Dupliquez layer 1 using the CTRL copy - JOn layer 1 apply as a result of image adjustments -Fit (I set it to about 150)Change the mixing mode of the 1-layer copy to multiply Now select both the layers (layer1 and layer1 copy) and press CTRL-ALT-SHIFT-ETht new layer is called layer2, place the layer2 below the layer1. [picture] Also, hide Layer1. Switch to layer1 Copy and select the face area and the whole part where you don't want images using the Magic Wand (W) tool. After making the selection go to Layer2 and remove the selection. You need to repeat this process in order to get the perfect hair part for image collage. Make sure you have removed the white background from Layer2. Do not remove the eyes since we may want the image in the eyeball and eyes and eyebrows will not affect much. Now Unmask the layer1 and place the layer2 on top of all the layers. [picture] We're done with the image adjustment. That's what it's going to look like. [picture] Choose the photos you want to add in your collage, here I am using random images. [picture] Slide the first image, resize if necessary. (Don't forget to press the SHIFT button while resizing) [picture] Now add the cutting mask, go to your image layer press ALT and cut it to the layer below i.e. layer2 (you'll see a cut mask icon as shown in the image) [picture] Move the cut image to the desired section of the hairs. Slide the next image, place it and resize it, add the cutting mask in the same way, move to the desired piece, if required rotate it. Do the same for other images. I attach a 1.4 minute video that shows how I cut all the images on her hair. I used the eraser tool, adjusted opacity in a few photos and changed the mixing mode of 1 or 2 photos if necessary. Now add a fresh background to give it a perfect finish. Download these models from Creative Market add them above the background layer. [picture] It's over! Go to the web file for digital view and for print-record in PDF or EPS format. I attach 2 more photo collages that I gave to my friends :)You can also print yours and frame it. This will surely make that person you donate very happy. I hope you :) Must share photo collage in the comments box. It is rare to see someone sit down and flip through a photo album. We are sending more and more photos via email and sharing our memories online. And because digital cameras are so easy to use, we're taking more pictures than ever before. Yes, the number of photos is increasing, but the importance of the memories they reflect has not diminished. In fact, it's more important than ever to make sure our photos are well supported. In addition, we always want to show the beautiful images of our last trip in the simplest way possible. If we don't take a leather album to our friend's house to show her pictures of our European holidays, then how do we share our photos? The answer is digital. If you don't know how to start your digital photo album, read on to learn more about the great tools for your photo album of the future. Content To start your digital photo album, you'll first need to get photos from your camera to your computer. Simply plug your camera into your computer's USB port. Typically, the software automatically uploads photos from your camera to a folder you've set up on your computer. The advantage of gettingting them is that your photos are already organized. Your best bet is to get digital album software that will help you upload your photos in an organized and efficient way. There are several options like Picasa or Snapfish and they are free to download and use. Look for a program that allows you to tag your photos, keep them in chronological order and allow you to access them later. In addition, most image software will allow you to put keywords or labels on your photos so you can search for specific images by simply typing France 2009, if you wish. Finally, with all your photos organized in one place, you can quickly delete blurry shots or duplicates that would otherwise just take up space. Now you have the debut of a lean and nasty digital photo album [source: Basic Digital Photography]. Advertising If you've ever worked on a computer, you know the horrible feeling of seeing your work disappear before your eyes due to a malfunction of one kind or another. If you write a paper term or label your photos, lose this valuable information frustrating and depressing beyond that. But, it is a feeling that can be avoided. That's where your external hard drive comes in. An external hard drive is an extra place to store important information from your computer. Because it's separate from your processor, anything that happens wrong to your computer will leave your external hard drive intact [source: Digital Photos 101]. 101], they will be plug and play, which means that all you really have to do is plug the hard drive into your computer and the rest is supported. Best of all, the price of hard drives is down while the amount of space you can get is on the rise. So if you have a hard drive with 2 terabytes of space (over 2,000GB) you can store more than 400,000 photos on it. Advertising What's the point of having all these photos if you're not going to show them? The problem with a digital photo album compared to a physical album is that it is much more difficult to carry around your computer than a printed photo envelope. Don't worry. There are great ways to keep your digital photos and show them whenever you want. You can probably plug your camera directly into your TV, but you'll lose the impression of the album you created on your computer. A better idea is to use engraving software and transfer your album to a DVD. There are many programs available that allow you to drag and drop your files and then burn them onto a disk. Once it's over, you'll be able to pop the DVD into any standard DVD player, sit back and enjoy your photos on any TV [source: Basic Digital Photography]. Advertising If you are looking for an easy way to share your photos, then you will be well served to check the variety of photo albums available online. They are easy to use and they allow you to access your photos from anywhere you can get an internet connection. The first step is to register for the program of your choice. It's an easy process that will allow you to upload your photos. Depending on the site, you may have a limitation on the amount of space you can use. As a general rule, free sites have more restrictions than subscription-based sites. Advertising After downloading your photos and organizing them by date, put them in folders and email them to friends and family. This way, you can have your photos in a localized location without having to worry about searching your computer's hard drive for them. In addition, you can share your photos with anyone you want [source: Middleton Public Library]. One of the most important things you can do with your digital album is to make sure you've saved it in at least one place. The last thing you want to do is try to find your child's 5th birthday photos, only to discover that they have been inadvertently deleted somewhere along the way. Once lost, it is very difficult to recover photos Of course, the external hard drive we mentioned earlier is a good way to roll back your photos, but it doesn't hurt to go a little old-school and make a paper copy. That doesn't mean you have to print every photo you own - it would take a lot of time and would be very expensive. No, the best way to keep a hard copy of your photos is to burn them on a CD or DVD. Today, DVDs are available in sizes of up to 8GB, which means they can contain a lot of photos. Burning your albums on disc ensures that no matter what happens to your or hard drive, you'll have your photos in a place where electronic malfunctions can't touch them [source: Digital Photos 101]. Advertising Do you have a ton of precious old movies, photos and VHS tapes sitting in dust collection boxes? It's time to go digital and preserve those memories for future generations.
